## 1

# Introduction

## Introduction

### 1.1 Description

MM32L0xx(named as "the device" throughout this document) is ARM® Cortex™-M0 32-bit RISC core based micro controller family. The device has high speed embedded memory and the CPU, memory and AHB bus subsystem speed can attain up to 48MHz. The device also has integrated with extensive range of enhanced I/Os, two APB buses peripherals, 1 12-bit ADC, 2 Comparators, 1 general purpose 16-bit timer, 1 general purpose 32-bit timer, 3 Basic timers, 1 Advanced 16-bit timer, and standard communication interfaces device: 1 I2C, 2 SPIs, 1 USB, 1 CAN, and 2 UARTs.

The device works between 2.0V to 5.5V range. The normal temperature for the device is -40°C to +85°C and -40°C to +105°C extended temperature range devices are also available upon ordering. A comprehensive set of power-saving mode allows the design of low-power applications.

The devices are available in 4 different packages: LQFP48, LQFP32, QFN32 and TSSOP20. Depending on the device chosen, different sets of peripherals are included.

The abundant peripheral configurations enable the device to fit wide range of applications in difference industries, Few examples are as follows:

- Motor drive and application control
- Healthcare and fitness equipment
- PC peripherals, gaming, GPS equipment
- Industrial Applications: Programmable Controllers (PLCs), Inverters, Printers and Scanners
- Alarm system, wired and wireless sensors, video intercom

### 1.2 Product Features

- Core and system
  - ARM® Cortex™-M0 CPU
  - Maximum operating frequency is up to 48MHz
- Memories
  - 128K Bytes of Flash memory
  - 8K Bytes of SRAM
  - Boot loader support Chip Flash and ISP (In-System Programming)

- Clock, reset and power management
  - 2.0V to 5.5V application supply
  - Power-on/Power-down reset (POR/PDR), Programmable voltage detector (PVD)
  - External 2 to 24MHz high speed crystal oscillator
  - Embedded factory-tuned 48MHz high speed oscillator
  - Embedded 40KHz low speed oscillator
  - PLL supports CPU running at 48MHz
- Low-power
  - Sleep, Stop and Standby modes
- 1 12-bit ADC, 1 $\mu$ S A/D converters (up to 10 channels)
  - Conversion range: 0 to  $V_{DDA}$
  - Support sampling time and resolution configuration
  - On-chip temperature sensor
- 2 Comparators
- 5 DMA controller
  - Supported peripherals: Timer, UART, I2C, SPI, ADC and USB
- Up to 39 fast I/Os:
  - All mappable on 16 external interrupt vectors
  - Almost all can work on 5V
- Debug mode
  - Serial wire debug (SWD)
- Up to 9 timers
  - 1 16-bit 4-channel advanced-control timer for 4 channels PWM output, with deadtime generation and emergency stop
  - 1 16-bit timer and 1 32-bit timer, with up to 4 IC/OC, usable for IR control decoding
  - 2 16-bit timer, with 1 IC/OC, 1 OCN, deadtime generation and emergency stop and modulator gate for IR control
  - 1 16-bit timer, with 1 IC/OC
  - 2 watchdog timers (independent and window type)
  - SysTick timer: 24-bit downcounter
- Up to 7 Communication interfaces
  - 2 UARTs
  - 1 I2C
  - 2 SPIs
  - 1 CAN
  - 1 USB
- 96-bit unique ID (UID)
- Packages LQFP48, LQFP32, QFN32 and TSSOP20

For more information about the complete product, refer to Section 2.2 of the data sheet. The relevant information about the Cortex<sup>TM</sup>-M0, please refer to Cortex<sup>TM</sup>-M0 technical reference manual.

## 2.2 Summary

### 2.2.1 ARM® Cortex™-M0 and SRAM

The ARM® Cortex™-M0 is a generation of ARM processors for embedded systems. It has been developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced system response to interrupts.

The ARM® Cortex™-M0 processors feature exceptional code-efficiency, delivering the high performance expected from an ARM core, with memory sizes usually associated with 8- and 16-bit devices.

The devices have embedded ARM core and are compatible with all ARM tools and software.

### 2.2.2 Memory

128K Bytes of embedded Flash memory.

## 2.2.3 SRAM

8K Bytes of embedded SRAM.

## 2.2.4 Clocks and startup

When the system is powered up, the default clock is from PLL with the resource from HSE 48 MHz oscillator. An external 2 ~ 24 MHz clock can also be configured to monitor the system during power up phases.

Several prescalers allow the application to configure the frequency of the AHB and the APB domains. The maximum frequency of the AHB and the APB domains is 48MHz. Refer to figure 3 for the clock drive block diagram.

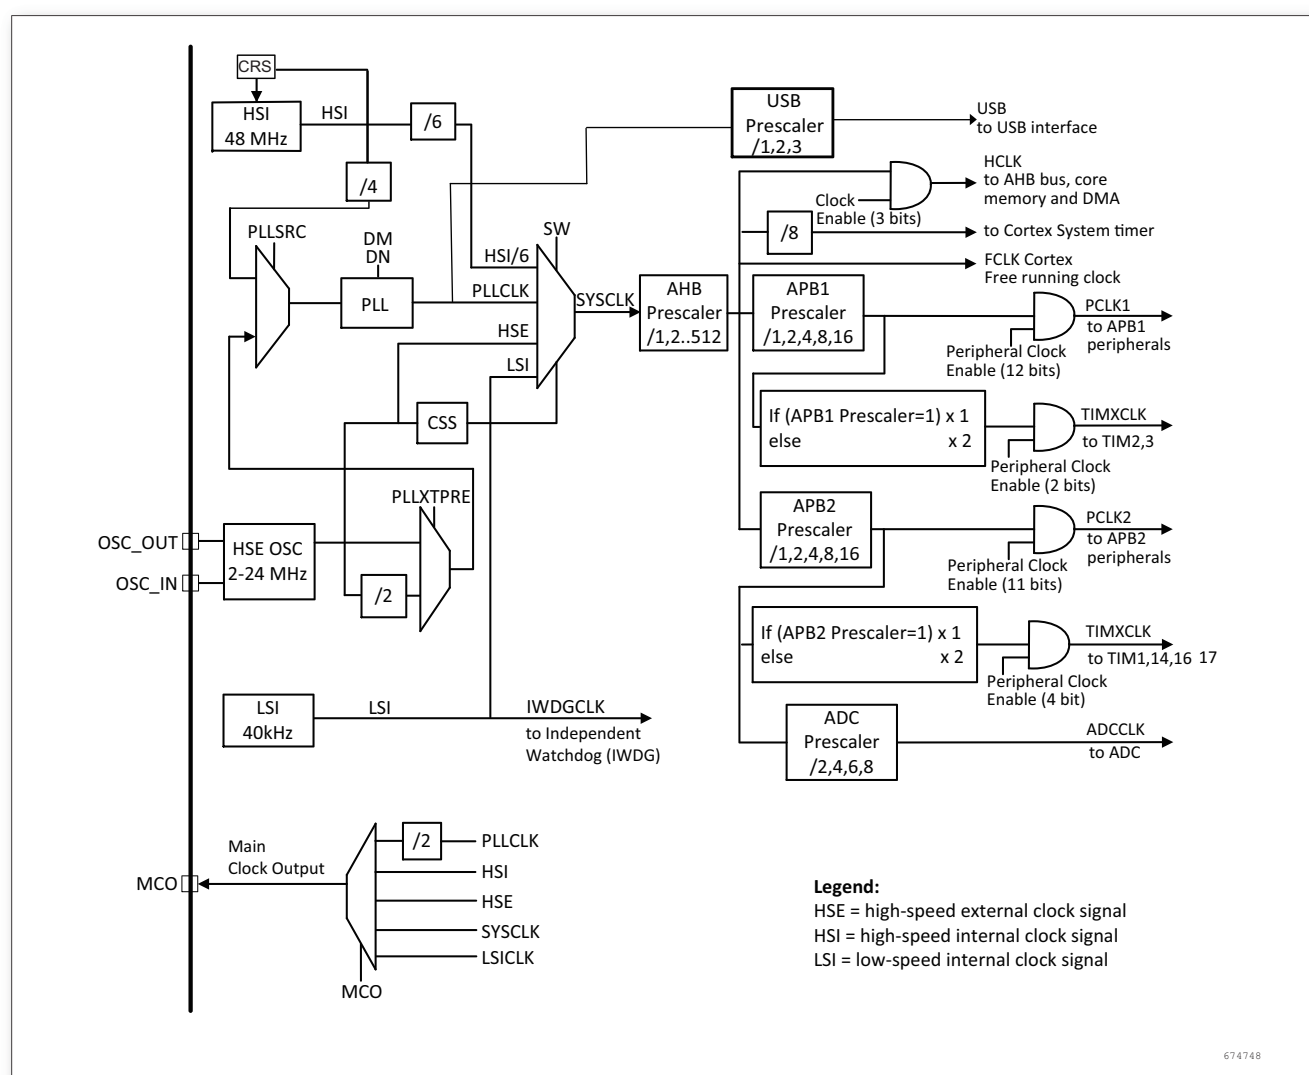

Figure 1. Clock tree

### 2.2.5 Nested vectored interrupt controller (NVIC)

The device embeds a nested vectored interrupt controller and is able to handle up to 68 maskable interrupt channels (not including the 16 interrupt lines of Cortex™-M0) with 16 priority levels.

- Closely coupled NVIC gives low latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Closely coupled NVIC core interface
- Allows early processing of interrupts
- Processing of late arriving higher priority interrupts
- Support for tail-chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

This hardware block provides flexible interrupt management features with minimal interrupt latency.

### 2.2.6 Extended interrupt/event controller (EXTI)

The extended interrupt/event controller consists of many edge detector lines are used to generate interrupt/event requests for waking up the system. Each line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The EXTI can detect an external line with a pulse width shorter than the internal APB2 clock period. All GPIOs can be connected to the 16 external interrupt lines.

### 2.2.7 Boot modes

At startup, the boot pin and boot selector option bit are used to select one of the three boot options:

- Boot from User Flash memory
- Boot from System Memory
- Boot from embedded SRAM

The boot loader is located in System Memory. It is used to reprogram the Flash memory by using UART1.

### 2.2.8 Power supply schemes

- $V_{DD} = 2.0V \sim 5.5V$ : external power supply for I/Os and the internal regulator. Provided externally through  $V_{DD}$  pins.
- $V_{SSA}, V_{DDA} = 2.0V \sim 5.5V$ : external analog power supply for reset blocks, oscillators and PLL.  $V_{DDA}$  and  $V_{SSA}$  must be connected to  $V_{DD}$  and  $V_{SS}$ .

## 2.2.9 Power supply supervisors

The device has integrated power-on reset (POR) and power-down reset (PDR) circuits. They are always active, and ensure proper operation above a threshold of 1.8V. The device remains in reset mode when the monitored supply voltage is below a specified threshold  $V_{POR/PDR}$ , without the need for an external reset circuit.

The device features an embedded programmable voltage detector (PVD) that monitors the  $V_{DD}/V_{DDA}$  power supply and compares it to the  $V_{PVD}$  threshold. An interrupt can be generated when VDD drops below the  $V_{PVD}$  threshold and/or when VDD is higher than the  $V_{PVD}$  threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

## 2.2.10 Voltage regulator

The voltage regulator converts the external voltage to the internal digital logic and it is always enabled after reset.

## 2.2.11 Low-power modes

The device support three low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources.

### Sleep mode

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.

### Stop mode

Stop mode achieves very low power consumption while retaining the content of SRAM and registers. the HSI and the HSE crystal oscillators are disabled. The voltage regulator can also be put either in normal or in low power mode.

### Standby mode

Standby mode achieves the lowest power consumption of the system. This mode turns off the voltage regulator in CPU deep sleep mode. The entire 1.5V power supply area is powered down. PLL, HSI and HSE oscillators are also powered down. SRAM and register contents are missing. Only the backup registers and standby circuits remain powered.

## 2.2.12 Direct memory access controller (DMA)

The 5-channel general-purpose DMAs manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. The DMA supports circular buffer management, removing the need for user code intervention when the controller reaches the end of the buffer.

Each channel is connected to dedicated hardware DMA requests, with support for soft-

ware trigger on each channel. Configuration is made by software and transfer sizes between source and destination are independent.

DMA can be used with the main peripherals: UART、I2C、SPI、USB、CAN、ADC general-purpose and advanced-control timers TIMx.

### 2.2.13 Backup register (BKP)

The backup registers are ten 16-bit registers used to store 20 bytes of user application data when  $V_{DD}$  power is not present. They are still powered by  $V_{BAT}$ . They are also not reset when the system is woken up in standby mode, or when the system is reset or power is reset.

### 2.2.14 Timers and watchdogs

Medium capacity device include 1 advanced control、5 general-purpose timers、2 watchdog timers and 1 SysTick timer.

The following table compares the features of the different timers:

Table 4. Timer feature comparison

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/-compare channels	Complementary outputs
Advanced control	TIM1	16-bit	Up, down, up/down	integer from 1 to 65536	Yes	4	Yes
General purpose	TIM2	32-bit	Up, down, up/down	integer from 1 to $2^{32} - 1$	Yes	4	No
	TIM3	16-bit	Up, down, up/down	integer from 1 to 65536	Yes	4	No
basic	TIM14	16-bit	Up	integer from 1 to 65536	Yes	1	No
	TIM16 / TIM17	16-bit	Up	integer from 1 to 65536	Yes	1	Yes

### Advanced-control timer ( TIM1 )

The advanced-control timer can be seen as a three-phase PWM multiplexed on six channels. It has complementary PWM outputs with programmable inserted dead times. It can also be seen as a complete general-purpose timer. The four independent channels can

be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned modes)
- One-pulse mode output

If configured as a standard 16-bit timer, it has the same features as the TIMx timer. If configured as the 16-bit PWM generator, it has full modulation capability (0 ~ 100%).

In debug mode, the counter can be frozen and the PWM output is disabled to cut off the switches controlled by these outputs.

Many features are shared with those of the standard timers which have the same architecture. The advanced control timer can therefore work together with the other timers via the Timer Link feature for synchronization or event chaining.

## **General-purpose timers (TIMx)**

There are 5 synchronizable general-purpose timers (TIM2、TIM3 ).

### **General-purpose timers 32-bit**

The timer is based on a 32-bit auto-reload up/downcounter and a 16-bit prescaler. The feature is 4 independent channels each for input capture/output compare, PWM or one-pulse mode output.

### **General-purpose timers 16-bit**

#### **TIM3**

The timer is based on a 16-bit auto-reload up/downcounter and a 16-bit prescaler. The feature is 4 independent channels each for input capture/output compare, PWM or one-pulse mode output.

The timer can work together or with the TIM1 advanced-control timer via the Timer Link feature for synchronization or event chaining. Their counter can be frozen in debug mode. Any of the general-purpose timers can be used to generate PWM outputs. They all have independent DMA request generation.

These timers are capable of handling quadrature (incremental) encoder signals and the digital outputs from 1 to 3 hall-effect sensors.

#### **TIM14**

This timer is based on a 16-bit auto-reload upcounter and a 16-bit prescaler. TIM14 features one single channel for input capture/output compare, PWM or one-pulse mode output. Their counter can be frozen in debug mode.

## **TIM16/TIM17**

Every timer is based on a 16-bit auto-reload upcounter and a 16-bit prescaler. They each have a single channel for input capture/output compare, PWM or one-pulse mode output. TIM16 and TIM17 have a complementary output with dead-time generation and independent DMA request generation. Their counters can be frozen in debug mode.

## **Independent watchdog (IWDG)**

The independent watchdog is based on an 8-bit prescaler and 12-bit downcounter with user-defined refresh window. It is clocked from an independent 40 KHz internal oscillator and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

## **System window watchdog (WWDG)**

The system window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the APB clock (PCLK). It has an early warning interrupt capability and the counter can be frozen in debug mode.

## **SysTick timer**

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

- A 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0
- Programmable clock source

## **2.2.15 Universal asynchronous receiver/transmitter (UART)**

UART provides hardware management of the CTS, RTS.

Support LIN master-slave function.

All UART interface can be served by the DMA controller.

## **2.2.16 I2C interface**

The I2C interface can operate in multimaster or slave modes. It can support Standard mode, and Fast Mode.

It supports 7-bit and 10-bit addressing modes, multiple 7-bit slave addresses (two addresses, one with configurable mask).

### 2.2.17 Serial peripheral interface (SPI)

The SPI interface, in slave or master mode, can be configured to 1 ~ 32 bits per frame.

All SPI interface can be served by the DMA controller.

### 2.2.18 Universal serial bus (USB)

The microcontroller embeds a USB device peripheral compatible with the USB full-speed 12 Mbs. The USB interface implements a full-speed (12 Mbit/s) function interface. The dedicated 48 MHz clock is generated from the internal main PLL (the clock source must use a HSE crystal oscillator).

### 2.2.19 Controller area network (CAN)

The CAN is compliant with specifications 2.0 A and B (active) with a bit rate up to 1 Mbit/s. It can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers.

### 2.2.20 General-purpose inputs/outputs (GPIO)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. The I/O configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

### 2.2.21 Analog-to-digital converter (ADC)

The one 12-bit analog-to-digital converters is embedded into microcontrollers and the ADC shares up to 10 external channels, performing conversions in single-shot or scan modes. In scan mode, automatic conversion is performed on a selected group of analog inputs. The ADC can be served by the DMA controller.

The analog watchdog function allows very precise monitoring of all the way, multiple or all selected channels, and an interruption occurs when the monitored signal exceeds the preset threshold. The events generated by the general-purpose timers (TIMx) and the advanced-control timer (TIM1) can be internally connected to the ADC start trigger to allow the application to synchronize A/D conversion and timers.

### 2.2.22 Temperature sensor

The temperature sensor has to generate a voltage that varies linearly with temperature. The temperature sensor is internally connected to the input channel which is used to convert the sensor output voltage into a digital value.

### 2.2.23 Serial single line SWD debug port (SW-DP)

Built-in ARM two-wire serial debug port (SW-DP).

An ARM SW-DP interface is provided to allow a serial wire debugging tool to be connected to the MCU.

### 2.2.24 Comparator (COMP)

The devices embed 2 general purpose comparators. that can be used either as standalone devices (all terminal are available on I/Os) or combined with the timers. The comparators can be used for a variety of functions including:

- Wake-up from low-power mode triggered by an analog signal,
- Analog signal conditioning,
- Cycle-by-cycle current control loop when combined with the PWM output from a timer.
  
- Rail-to-rail comparators
- Each comparator has positive and configurable negative inputs used for flexible voltage
- Selection:
  - Reusable I/O pins
  - Internal comparison voltage CRV selects the voltage divider value of AVDD or internal reference voltage
- Programmable hysteresis
- Programmable speed/consumption
- The outputs can be redirected to an I/O or to timer inputs for triggering:
  - Capture events
  - OCref\_clr events (for cycle-by-cycle current control)
  - Break events for fast PWM shutdowns

1. I = input, O = output, S = power supply, HiZ = high resistance.

2. FT: 5V tolerant, Input signal should be between VDD and 5V.

TC: Standard I/O, Input signal does not exceed VDD.

## Electrical characteristics

### Electrical characteristics

### 5.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to  $V_{SS}$ .

#### 5.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed with an ambient temperature at  $T_A = 25^\circ\text{C}$ ,  $V_{DD} = 3.3\text{V}$ .

#### 5.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25^\circ\text{C}$  and  $V_{DD} = 3.3\text{V}$ . They are given only as design guidelines and are not tested.

#### 5.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 5.1.4 Loading capacitor

The load conditions used for pin parameter measurement are shown in the figure below.

Figure 8. Pin loading conditions

### 5.1.5 Pin input voltage

The input voltage measurement on a pin of the device is shown in the figure below.

Figure 9. Pin input voltage

### 5.1.6 Power supply scheme

The power supply design scheme is shown in the figure below.

Figure 10. Power supply scheme

### 5.1.7 Current consumption measurement

The measurement of the current consumption on the pin is shown in the figure below.

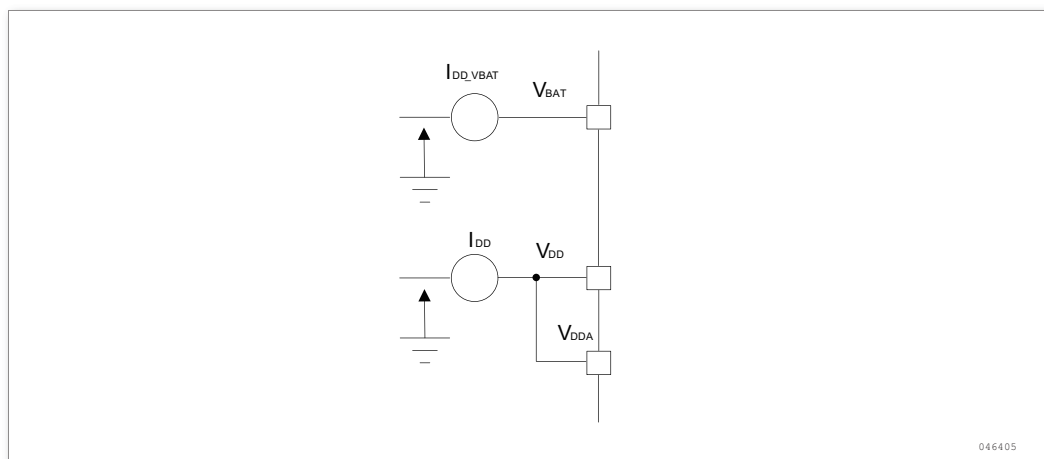

Figure 11. Current consumption measurement scheme

## 5.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in Tables (Table 10, Table 11, Table 12) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 10. Voltage characteristics

Symbol	Definition	Min	Max	Unit
$V_{DD} - V_{SS}$	External main supply voltage (including $V_{DDA}$ and $V_{SSA}$ ) <sup>(1)</sup>	- 0.3	5.5	V
$V_{IN}$	Input voltage on FT and FTf pins <sup>(2)</sup>	$V_{SS} - 0.3$	5.5	
	Input voltage on other pins <sup>(2)</sup>	$V_{SS} - 0.3$	5.5	
$ \Delta V_{DDx} $	Variations between different $V_{DD}$ power pins		50	mV
$ V_{SSx} - V_{SS} $	Variations between all the different ground pins		50	

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2.  $V_{IN}$  maximum must always be respected. Refer to Table below for maximum allowed injected current values.

Table 11. Current characteristics

Symbol	Definition	Max	Unit
$I_{VDD}$	Total current into sum of all $V_{DD}/V_{DDA}$ power lines (source) <sup>(1)</sup>	150	mA
$I_{VSS}$	Total current out of sum of all $V_{SS}$ ground lines (sink) <sup>(1)</sup>	150	mA

Symbol	Definition	Max	Unit
$I_{IO}$	Output current sunk by any I/O and control pin	20	mA
$I_{IO}$	Output current source by any I/O and control pin	-18	mA
$I_{INJ(PIN)}^{(2)(3)}$	Injected current on NRST pins	$\pm 5$	mA
$I_{INJ(PIN)}^{(2)(3)}$	Injected current on OSC_IN pin of HSE and OSC_IN pin of LSE	$\pm 5$	mA
$I_{INJ(PIN)}^{(2)(3)}$	Injected current on other pins <sup>(4)</sup>	$\pm 5$	mA
$\Sigma I_{INJ(PIN)}^{(2)}$	Total injected current(sum of all I/O and control pins) <sup>(4)</sup>	$\pm 25$	mA

1. All main power( $V_{DD}$ ,  $V_{DDA}$ ) and ground( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2.  $I_{INJ(PIN)}$  cannot exceed its limit, that is, to ensure that the  $V_{IN}$  does not exceed its maximum value. If  $V_{IN}$  does not guarantee that its maximum value is not exceeded, ensure that  $I_{INJ(PIN)}$  does not exceed its maximum value under external restrictions. When  $V_{IN} > V_{DD}$ , there is a forward injection current; when  $V_{IN} < V_{SS}$ , there is a reverse injection current.
3. Negative injection disturbs the analog performance of the device.
4. When several inputs are submitted to a current injection, the maximum  $I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values).

Table 12. Thermal characteristics

Symbol	Definition	Max	Unit
$T_{STG}$	Storage temperature range	- 45 ~ + 150	°C
$T_J$	Maximum junction temperature	125	°C

## 5.3 Operating conditions

### 5.3.1 General operating conditions

Table 13. General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{HCLK}$	Internal AHB clock frequency		0	96	MHz
$f_{PCLK1}$	Internal APB1 clock frequency		0	$f_{HCLK}$	
$f_{PCLK2}$	Internal APB2 clock frequency		0	$f_{HCLK}$	
$V_{DD}^{(1)}$	Standard operating voltage		2.0	5.5	V

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{DDA}$	Analog operating voltage	Must be the same voltage as $V_{DD}$ <sup>(1)</sup>	2.5	5.5	V
$V_{BAT}$	Backup part of working voltage		1.8	5.5	V
$P_D$	Power dissipation temperature: $T_A = 85^\circ\text{C}$ <sup>(2)</sup>	LQFP64		203	mW
		LQFP48			
		LQFP32/QFN32			
$T_A$	Ambient temperature: $T_A = 85^\circ\text{C}$	Maximum power dissipation	-40	85	$^\circ\text{C}$
		Low power dissipation <sup>(3)</sup>	-40	105	
	Ambient temperature: $T_A = 105^\circ\text{C}$	Maximum power dissipation	-40	105	$^\circ\text{C}$
		Low power dissipation <sup>(3)</sup>	-40	125	

1. It is recommended to use the same power supply for  $V_{DD}$  and  $V_{DDA}$ , the maximum permissible difference between  $V_{DD}$  and  $V_{DDA}$  is 300mV during power up and normal operation.
2. If  $T_A$  is low, higher  $P_D$  values are allowed as long as  $T_J$  does not exceed  $T_{Jmax}$  (See subsec 5.1).
3. In low power dissipation state,  $T_A$  can be extended to this range as long as  $T_J$  does not exceed  $T_{Jmax}$  (See subsec 5.1).

### 5.3.2 Operating conditions at power-up/power-down

The parameters given in the table below are based on tests under normal operating conditions.

Table 14. Operating conditions at power-up/power-down

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{VDD}$	$V_{VDD}$ rise time rate	$T_A = 27^\circ\text{C}$	100	$\infty$	$\mu\text{S/V}$
	$V_{VDD}$ fall time rate		100	$\infty$	

### 5.3.3 Embedded reset and power control block characteristics

The parameters given in the table below are based on the ambient temperature and the  $V_{DD}$  supply voltage listed in Table 13.

Table 15. Embedded reset and power control block characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
		PLS[3: 0]=0000 (Rising edge)	1.813	1.819	1.831	V
		PLS[3: 0]=0000 (Falling edge)		1.705		V
		PLS[3: 0]=0001 (Rising edge)	2.112	2.116	2.124	V
		PLS[3: 0]=0001 (Falling edge)		2.0		V

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
		PLS[3: 0]=0010 (Rising edge)	2.411	2.414	2.421	V
		PLS[3: 0]=0010 (Falling edge)		2.297		V
		PLS[3: 0]=0011 (Rising edge)	2.711	2.714	2.719	V
		PLS[3: 0]=0011 (Falling edge)		2.597		V
		PLS[3: 0]=0100 (Rising edge)	3.011	3.013	3.018	V
		PLS[3: 0]=0100 (Falling edge)		2.895		V
		PLS[3: 0]=0101 (Rising edge)	3.311	3.313	3.317	V
		PLS[3: 0]=0101 (Falling edge)		3.194		V
		PLS[3: 0]=0110 (Rising edge)	3.611	3.613	3.616	V
		PLS[3: 0]=0110 (Falling edge)		3.494		V
		PLS[3: 0]=0111 (Rising edge)	3.91	3.913	3.916	V
		PLS[3: 0]=0111 (Falling edge)		3.793		V
		PLS[3: 0]=1000 (Rising edge)	4.21	4.212	4.215	V
		PLS[3: 0]=1000 (Falling edge)		4.092		V
		PLS[3: 0]=1001 (Rising edge)	4.51	4.512	4.515	V
		PLS[3: 0]=1001 (Falling edge)		4.391		V
		PLS[3: 0]=1010 (Rising edge)	4.809	4.811	4.813	V
		PLS[3: 0]=1010 (Falling edge)		4.69		V
$V_{PVDhyst}^{(2)}$	PVD hysteresis			100		mV
$V_{POR/PDR}$	Power on/down reset threshold	Falling edge	1.63 <sup>(1)</sup>	1.66	1.68	V
		Rising edge		1.75		V
$V_{PDRhys}^{(2)}$	PDR hysteresis			90.9		mV
$T_{RSTTEMPO}^{(2)}$	Reset duration			20		ms

1. The product behavior is guaranteed by design down to the minimum value  $V_{POR/PDR}$ .
2. Guaranteed by design, not tested in production.

*Note: The reset duration is measured from power-on (POR reset) to the time when the user application code reads the first instruction.*

### 5.3.4 Embedded internal reference voltage

The parameters given in the table below are based on the ambient temperature and the  $V_{DD}$  supply voltage listed in Table 13.

Table 16. Embedded internal reference voltage<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{REFINT}$	Internal reference voltage	$-40^{\circ}\text{C} < T_A < +105^{\circ}\text{C}$		1.2		V
		$-40^{\circ}\text{C} < T_A < +85^{\circ}\text{C}$		1.2		V

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$T_{S\_vrefint}^{(1)}$	ADC sampling time when reading the internal reference voltage		40			$\mu S$

1. Shortest sampling time can be determined in the application by multiple iterations.

### 5.3.5 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

All Run-mode current consumption measurements given in this section are performed with a reduced code.

#### Maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in analog input mode, and are connected to a static level —  $V_{DD}$  or  $V_{SS}$  (no load)
- All peripherals are disabled except when explicitly mentioned
- The Flash memory access time is adjusted to the  $f_{HCLK}$  (0 ~ 24 MHz is 0 waiting period, 24 ~ 48 MHz is 1 waiting period, 48 ~ 72 MHz is 2 waiting period, 72 ~ 96 MHz is 3 waiting period).
- The instruction prefetching function is on. When the peripherals are enabled:  
 $f_{PCLK1} = f_{HCLK}$ .

*Note: The instruction prefetching function must be set before setting the clock and bus divider.*

The parameters given in the table (Table 17、Table 18、Table 19) are based on the ambient temperature and the  $V_{DD}$  supply voltage listed in Table 13.

Table 17. Typical current consumption in Run mode, code executing from Flash memory

Symbol	Parameter	Conditions	$f_{HCLK}$	Typ <sup>(1)</sup>		Unit
				All peripherals enabled <sup>(2)</sup>	All peripherals disabled	
$I_{DD}$	Supply current in run mode	External clock <sup>(2)</sup>	96MHz	26.23	15.2	mA
			72MHz	20.52	12.19	
			48MHz	14.71	9.13	
			36MHz	11.76	7.58	
			24MHz	8.84	6.03	
$I_{DD}$	Supply current in run mode	External clock <sup>(2)</sup>	8MHz	4.1	3.14	

1. The typical value is tested at  $T_A = 25^\circ\text{C}$ . Guaranteed by design, not tested in production.
2. External clock is 8MHz, when  $f_{\text{HCLK}} > 8\text{MHz}$  enable PLL.

Table 18. Typical current consumption in Sleep mode, code executing from Flash memory or RAM

Symbol	Parameter	Conditions	$f_{\text{HCLK}}$	Typ <sup>(1)</sup>		Unit
				All peripherals enabled <sup>(2)</sup>	All peripherals disabled	
$I_{\text{DD}}$	Supply current in Sleep mode	External clock <sup>(2)</sup>	96MHz	22.41	10.92	mA
			72MHz	17.57	8.96	
			48MHz	12.68	6.96	
			36MHz	10.29	5.95	
			24MHz	7.79	4.9	
			8MHz	3.46	2.8	

1. The typical value is tested at  $T_A = 25^\circ\text{C}$ . From a comprehensive evaluation, it is tested in terms of  $V_{\text{DDmax}}$  and  $f_{\text{HCLKmax}}$  enable peripherals in production.
2. External clock is 8MHz, when  $f_{\text{HCLK}} > 8\text{MHz}$  enable PLL.

Table 19. Maximum current consumption in Stop and Standby mode, code executing from Flash memory

Symbol	Parameter	Conditions	Max	Unit
			$T_A = 25^\circ\text{C}$	
$I_{\text{DD}}$	Supply current in Stop mode	Enter the stop mode after reset, $V_{\text{DD}} = 3.3\text{V}$	402	$\mu\text{A}$
	Supply current in Standby mode	Enter the standby mode after reset, $V_{\text{DD}} = 3.3\text{V}$	0.4	
$I_{\text{DD\_VBAT}}$	Supply current in the backup area	Low speed oscillator and RTC are on, $V_{\text{DD}}/V_{\text{BAT}} = 3.3\text{V}$	0.2	$\mu\text{A}$

1. I/O status is analog input.

Figure 12. Typical current consumption in standby mode vs. temperature at  $V_{DD} = 3.3V$

### Typical current consumption

The MCU is placed under the following conditions:

- All I/O pins are in analog input configuration, and are connected to a static level —  $V_{DD}$  or  $V_{SS}$  (no load).
- All the peripherals are closed, unless otherwise specified.
- The Flash memory access time is adjusted to the  $f_{HCLK}$  (0 ~ 24 MHz is 0 waiting period, 24 ~ 48 MHz is 1 waiting period, 48 ~ 72 MHz is 2 waiting period, 72 ~ 96 MHz is 3 waiting period).
- The ambient temperature and  $V_{DD}$  supply voltage conditions are summarized in Table 13.
- The instruction prefetching function is on. When the peripherals are enabled:  
 $f_{PCLK1} = f_{HCLK}$ .

*Note: The instruction prefetch function must be set before the clock is set and the bus is divided.*

### On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in Table 20. The MCU is placed under the following conditions:

- All I/O pins are in analog input mode, and are connected to a static level —  $V_{DD}$  or  $V_{SS}$  (no load).
- All peripherals are disabled except when explicitly mentioned.
- The given value is calculated by measuring the current consumption.
  - with all peripherals clocked OFF
  - with only one peripheral clocked on

- Ambient operating temperature and supply voltage conditions  $V_{DD}$  summarized in Table 13.

Table 20. On-chip peripheral current consumption<sup>(1)</sup>

Peripheral		Typical consumption at 25 °C	Unit	Peripheral		Typical consumption at 25 °C	Unit
APB1	TIM2	0.098	mA	APB2	GPIOA	0.045	mA
	TIM3	0.062			GPIOB	0.046	
APB1	TIM4	0.055	mA	APB2	GPIOC	0.052	mA
	SPI2	0.133			GPIOD	0.046	
	UART2	0.077			ADC1	0.051	
	UART3	0.078			ADC2	0.052	
	I2C1	0.132			TIM1	0.121	
	I2C2	0.134			SPI1	0.122	
	USB	0.058			UART1	0.078	
	CAN	0.033					

1.  $f_{HCLK} = 96\text{MHz}$ ,  $f_{APB1} = f_{HCLK}/2$ ,  $f_{APB2} = f_{HCLK}$ , the prescale coefficient for each device is the default value.

### 5.3.6 External clock source characteristics

#### High-speed external user clock generated from an external source

The characteristic parameters given in the following table are measured using a high-speed external clock source, ambient temperature and power supply voltage meet the conditions of General operating conditions.

Table 21. High-speed external user clock characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSE\_ext}$	User external clock source frequency <sup>(1)</sup>		2	8	24	MHz
$V_{HSEH}$	OSC_IN input pin high level voltage		$0.7V_{DD}$		$V_{DD}$	V
$V_{HSEL}$	OSC_IN input pin low level voltage		$V_{SS}$		$0.3V_{DD}$	
$t_{w(HSE)}$	OSC_IN high or low time <sup>(1)</sup>		16			nS
$t_{r(HSE)}$ $t_{f(HSE)}$	OSC_IN rise or fall time <sup>(1)</sup>				20	
$C_{in(HSE)}$	OSC_IN input capacitance <sup>(1)</sup>			5		pF
$DuCy_{(HSE)}$	Duty cycle		45		55	%
$I_L$	OSC_IN input leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$			$\pm 1$	uA

1. Guaranteed by design, not tested in production.

### Low-speed external user clock characteristics

The characteristic parameters given in the following table are measured using a low-speed external clock source, ambient temperature and power supply voltage meet the conditions of General operating conditions.

Table 22. Low-speed external user clock characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSE\_ext}$	User external clock source frequency <sup>(1)</sup>		16	32.768	200	KHz
$V_{LSEH}$	OSC_IN input pin high level voltage				1.2	V
$V_{LSEL}$	OSC_IN input pin low level voltage		0.25			V
$t_{w(LSE)}$	OSC_IN high or low time <sup>(1)</sup>			15259		nS
$t_{r(LSE)}$	OSC_IN rise time <sup>(1)</sup>			30		nS
$t_{f(LSE)}$	OSC_IN fall time <sup>(1)</sup>			30		nS
$C_{in(LSE)}$	OSC_IN input capacitance <sup>(1)</sup>			5		pF
$DuCy_{(LSE)}$	Duty cycle			50		%
$I_L$	OSC_IN input leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$		0.03		uA

1. Guaranteed by design, not tested in production.

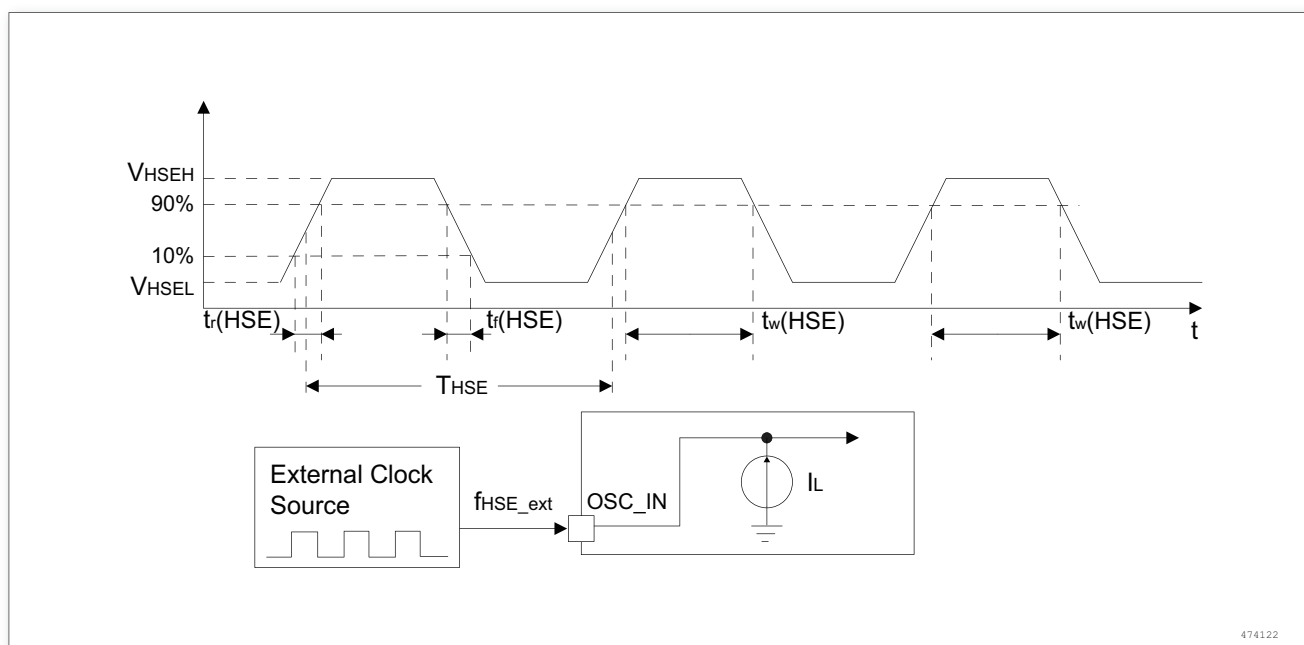

Figure 13. High-speed external clock source AC timing diagram

Figure 14. Low-speed external clock source AC timing diagram

### High-speed external clock generated from a crystal/ceramic resonator

The high-speed external (HSE) clock can be supplied with an 2 to 24 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in the table below. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy...).

Table 23. HSE oscillator characteristics<sup>(1)(2)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{OSC\_IN}$	Oscillator frequency		2	8	24	MHz
$R_F$	Feedback resistor	$R_S = 30\Omega$		1000		k $\Omega$
$C_{L1}$ $C_{L2}^{(3)}$	The proposed load capacitance corresponds to the crystal serial impedance ( $R_S$ ) <sup>(4)</sup>	$V_{DD} = 3.3V$ $V_{IN} = V_{SS}$ 30pF load		30		pF
$I_2$	HSE current consumption	Startup			1	mA
$g_m$	Oscillator transconductance	$V_{DD}$ is stabilized	25			mA/V
$t_{SU(HSE)}^{(5)}$	Startup time	$R_S = 30\Omega$		2		mS

1. Resonator characteristics given by the crystal/ceramic resonator manufacturer characteristics Parameter.

2. Guaranteed by design, not tested in production.
3. For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high-quality external ceramic capacitors in the 5 pF to 25 pF range (Typ.) , designed for high-frequency applications, and selected to match the requirements of the crystal or resonator.  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ . PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing  $C_{L1}$  and  $C_{L2}$ .
4. The relatively low value of the RF resistance can be used to avoid problems arising from the use of wet conditions to provide protection, this environment resulting in leakage and bias conditions have changed. However, if the MCU is applied in bad wet conditions, the design needs to take this parameter into account.
5.  $t_{SU(HSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

Figure 15. Typical application with an 8 MHz crystal

### Low-speed external clock generated from a crystal/ceramic resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in the table below. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy). Note: For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use a high quality ceramic capacitor between 5pF and 15pF and select the crystal or resonator that meets the requirements. Usually  $C_{L1}$  and  $C_{L2}$  have the same parameters. Crystal manufacturers typically give the parameters of the load capacitance in a serial combination of  $C_{L1}$  and  $C_{L2}$ . The load capacitance  $C_L$  is calculated by:  $C_L = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{stray}$ , where  $C_{stray}$  is the capacitance of the pin and the capacitance associated with the PCB or PCB. Its typical value is between 2pF and 7pF. WARNING: To avoid exceeding

the maximum value of  $C_{L1}$  and  $C_{L2}$  (15pF), it is highly recommended to use a resonator with a load capacitance of  $C_L \leq 7\text{pF}$ . A resonator with a load capacitance of 12.5pF cannot be used. For example, if a resonator with a load capacitance of  $C_L = 6\text{pF}$  is selected and  $C_{\text{stray}} = 2\text{pF}$ , then  $C_{L1} = C_{L2} = 8\text{pF}$ .

Table 24. LSI oscillator characteristics ( $f_{\text{LSE}}=32.768\text{KHz}$ ) <sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$R_F$	Feedback resistor			25		$\text{M}\Omega$
$C_{L1}$ $C_{L2}$ <sup>(2)</sup>	The proposed load capacitance corresponds to the crystal serial impedance ( $R_S$ ) <sup>(3)</sup>	$R_S = 30\Omega$			4	pF
$I_2$	LSE current consumption	$V_{DD} = 3.3\text{V}$ $V_{IN} = V_{SS}$		0.08		$\mu\text{A}$
$g_m$	Oscillator transconductance			0.5		$\mu\text{A/V}$
$t_{\text{SU(HSE)}}^{(4)}$	Startup time	$V_{DD}$ is stabilized		1	4	S

1. Guaranteed by design, not tested in production.
2. See the note and warning paragraphs above this table.
3. Selecting a high quality oscillator with a small  $R_S$  value (such as MSIV-TIN 32.768KHz) optimizes current consumption. Please consult the crystal manufacturer for details.
4.  $t_{\text{SU(HSE)}}$  is the start-up time, which is measured from the time the software enables HSE until a stable 8MHz oscillation is obtained. This value is measured on a standard crystal resonator, which may vary greatly depending on the crystal manufacturer.

Figure 16. Typical application with a 32.768 kHz crystal

### 5.3.7 Internal clock source characteristics

The characteristic parameters given in the table below are measured using ambient temperature and supply voltage in accordance with general operating conditions.

#### High-speed internal (HSI) oscillator

Table 25. HSI oscillator characteristics<sup>(1)(2)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{\text{HSI}}$	Frequency		40	48	64	MHz
$\text{ACC}_{\text{HSI}}$	Accuracy of the HSI oscillator	$T_A = -40^{\circ}\text{C} \sim 105^{\circ}\text{C}$	-5		5	%
$\text{ACC}_{\text{HSI}}$	Accuracy of the HSI oscillator	$T_A = -10^{\circ}\text{C} \sim 85^{\circ}\text{C}$	-3		3	%
$\text{ACC}_{\text{HSI}}$	Accuracy of the HSI oscillator	$T_A = 0^{\circ}\text{C} \sim 70^{\circ}\text{C}$	-2		2	%
$\text{ACC}_{\text{HSI}}$	Accuracy of the HSI oscillator	$T_A = 25$	-1		1	%
$t_{\text{SU(HSI)}}$	HSI oscillator startup time				2	$\mu\text{S}$
$I_{\text{DD(HSI)}}$	HSI oscillator power consumption			81	200	$\mu\text{A}$

1.  $V_{\text{DD}} = 3.3\text{V}$ ,  $T_A = -40^{\circ}\text{C} \sim 105^{\circ}\text{C}$ , unless otherwise specified.
2. Guaranteed by design, not tested in production.

### Low-speed internal (LSI) oscillator

Table 26. LSI oscillator characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{\text{LSI}}^{(2)}$	Frequency		31	40	75	KHz
$t_{\text{SU(LSI)}}^{(2)}$	LSI oscillator startup time				1	$\mu\text{S}$
$I_{\text{DD(LSI)}}^{(3)}$	LSI oscillator power consumption			1.1	1.7	$\mu\text{A}$

1.  $V_{\text{DD}} = 3.3\text{V}$ ,  $T_A = -40^{\circ}\text{C} \sim 105^{\circ}\text{C}$ , Unless otherwise stated
2. Comprehensive assessment, not tested in production.
3. Guaranteed by design, not tested in production.

### Wake-up times from low power mode

The wake-up times listed in the table below are measured during the wake-up phase of the internal clock HSI. The clock source used when waking up depends on the current operating mode:

- Stop or Standby mode: The clock source is the oscillator
- Sleep mode: The clock source is the clock used when entering sleep mode

All times are measured using ambient temperature and supply voltage in accordance with common operating conditions.

Table 27. Low-power mode wakeup timings

Symbol	Parameter	Conditions	Max	Unit
$t_{WUSLEEP}^{(1)}$	Wakeup from Sleep mode	HSI clock wakeup	4.2	$\mu\text{S}$
$t_{WUSTOP}^{(1)}$	Wakeup from Stop mode (The regulator is in run mode)	HSI clock wakeup = $2\mu\text{S}$	6.3	
$t_{WUSTDBY}^{(1)}$	Wakeup from Standby mode	HSI clock wakeup = $2\mu\text{S}$ The regulator wakes up from the off mode = $38\mu\text{S}$	47	mS

1. The wake-up time is measured from the start of the wake-up event to the user program to read the first instruction.

### 5.3.8 PLL characteristics

The parameters listed in the table below are measured using ambient temperature and supply voltage in accordance with common operating conditions.

Table 28. PLL characteristics<sup>(1)</sup>

Symbol	Parameter	Min	Typ	Max	Unit
$f_{PLL\_IN}$	PLL input clock <sup>(2)</sup>	2		24	MHz
	PLL input clock duty cycle	40		60	%
$f_{PLL\_OUT}$	PLL multiplier output clock	40		200	MHz
$t_{LOCK}$	PLL lock time			100	$\mu\text{S}$

1. Guaranteed by design, not tested in production.  
 2. Take care to use the appropriate multiplier factors to obtain PLL input clock values compatible with the range defined by  $f_{PLL\_OUT}$ .

### 5.3.9 Memory characteristics

#### Flash memory

The characteristics are given at  $T_A = -40^\circ\text{C} \sim 105^\circ\text{C}$  unless otherwise specified.

Table 29. Flash memory characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{prog}$	8-bit programming time	$T_A = -40^\circ\text{C} \sim 125^\circ\text{C}$	4			$\mu\text{S}$

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{ERASE}$	Page (512K bytes) erase time	$T_A = -40^{\circ}\text{C} \sim 125^{\circ}\text{C}$		4	5	mS
$t_{ME}$	Mass erase time	$T_A = -40^{\circ}\text{C} \sim 125^{\circ}\text{C}$	20		40	mS
$I_{DD}$	Supply current	Read mode, $f_{HCLK} = 48\text{MHz}$		5	6	mA
		Write mode, $f_{HCLK} = 48\text{MHz}$			7	mA
		Erase mode, $f_{HCLK} = 48\text{MHz}$			2	mA
$I_{SB}$	Standby current			1@25°C	50@125°C	μA
$I_{DEP}$	Deep Standby current			0.5	15@125°C	μA

Table 30. Flash memory endurance and data retention<sup>(1)(2)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
NEND	Endurance (Annotation: Erase number of times)	$T_A = -40^{\circ}\text{C} \sim 85^{\circ}\text{C}$ $T_A = -40^{\circ}\text{C} \sim 105^{\circ}\text{C}$	10			K cycle
$t_{RET}$	Data retention	1 K cycle <sup>(2)</sup> at $T_A = 85^{\circ}\text{C}$	30			Year
		1 K cycle <sup>(1)(2)</sup> at $T_A = 105^{\circ}\text{C}$	10			
		10 K cycle <sup>(1)(2)</sup> at $T_A = 55^{\circ}\text{C}$	20			

1. Guaranteed by design, not tested in production.
2. Cycle tests are carried out in the whole temperature range.

### 5.3.10 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

#### Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- Electrostatic discharge (ESD) (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- FTB: A Burst of Fast Transient voltage (positive and negative) is applied to VDD and VSS through a 100 pF capacitor, until a functional disturbance occurs. This test is

compliant with the IEC 1000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in the following table. They are based on the EMS levels and classes defined in application note.

Table 31. EMS characteristics

Symbol	Parameter	Conditions	Level/Class
$V_{EFT}$	Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance	$V_{DD} = 3.3V, T_A = +25^{\circ}C$ , $f_{HCLK} = 48MHz$ . Conforming to IEC 1000-4-4	TBD

## Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and pre-qualification tests in relation with the EMC level requested for his application.

## Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (for example control registers)

## Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors.

### 5.3.11 Absolute Maximum (Electrical Sensitivity)

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

## Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts  $\times$  (n+1) supply pins). This test conforms to the JESD22-A114/C101 standard.

## Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with EIA/JESD78A IC latch-up standard.

Table 32. ESD characteristics

Symbol	Parameter	Conditions	Type	Max	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (Human body model)	$T_A = +25^\circ\text{C}$ , Conforming to JESD22-A114		2000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (Charging device model)	$T_A = +25^\circ\text{C}$ , Conforming to JESD22-C101		500	
$I_{LU}$	Latch-up current	$T_A =$ $+25^\circ\text{C}$ , Conforming to JESD78A		200	mA

## 5.3.12 I/O port characteristics

### General input/output characteristics

Unless otherwise specified, the parameters given in Table 10 are derived from tests.

Table 33. I/O static characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL}$	Low level input voltage	CMOS Port	-0.5		1.1	V
$V_{IH}$	High level input voltage	CMOS Port	2.08			V
$V_{hys}$	Schmitt trigger hysteresis <sup>(1)</sup>		500	700	800	mV
$I_{lkg}$	Input leakage current <sup>(2)</sup>				1	$\mu\text{A}$
$R_{PU}$	Weak pull-up equivalent resistor <sup>(3)</sup>	$V_{IN} = V_{SS}$	30	50	100	$\text{k}\Omega$
$R_{PD}$	Weak pull-down equivalent resistor <sup>(3)</sup>	$V_{IN} = V_{DD}$	30	50	100	

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$C_{IO}$	I/O pin capacitance				5	pF

1. Schmitt Trigger switching hysteresis voltage level. Data based on design simulation only. Not tested in production.
2. The leakage could be higher than the maximum value, if negative current is injected on adjacent pins.
3. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This PMOS/NMOS contribution to the series resistance is minimal (10% order).

All I/Os are CMOS (no software configuration required). Their characteristics cover more than the strict CMOS-technology.

- For  $V_{IH}$ :
  - If  $V_{DD}$  is between [2.50V~ 3.08V]; use CMOS features.
  - If  $V_{DD}$  is between [3.08V~ 3.60V]; include CMOS.
- For  $V_{IL}$ :
  - Use CMOS features.

## Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to  $\pm 20\text{mA}$ .

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in 5.2:

- The sum of the currents obtained from  $V_{DD}$  for all I/O ports, plus the maximum operating current that the MCU obtains on  $V_{DD}$ , cannot exceed the absolute maximum rating  $I_{VDD}$ .
- The sum of the currents drawn by all I/O ports and flowing out of  $V_{SS}$ , plus the maximum operating current of the MCU flowing out on  $V_{SS}$ , cannot exceed the absolute maximum rating  $I_{VSS}$ .

## Output voltage levels

Unless otherwise stated, the parameters listed in the table below are measured using the ambient temperature and  $V_{DD}$  supply voltage in accordance with the condition Table 10. All I/O ports are CMOS compatible.

Table 34. Output voltage characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{OL}^{(1)}$	Output low level voltage for an I/O pin, when 8 pins absorb current	CMOS Port, $I_{IO} = +8\text{mA}$ $2.7\text{V} < V_{DD} < 3.6\text{V}$		0.4	

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{OH}^{(2)}$	Output high level voltage for an I/O pin, when 8 pins output current	CMOS Port, $I_{IO} = +8mA$ $2.7V < V_{DD} < 3.6V$	$0.8V_{DD}$		V
$V_{OL}^{(1)(3)}$	Output low level voltage for an I/O pin, when 8 pins absorb current	$I_{IO} = +20mA$ $2.7V < V_{DD} < 3.6V$		0.4	
$V_{OH}^{(2)(3)}$	Output high level voltage for an I/O pin, when 8 pins output current		$0.8V_{DD}$		
$V_{OL}^{(2)(3)}$	Output low level voltage for an I/O pin, when 8 pins absorb current	$I_{IO} = +6mA$ $2V < V_{DD} < 2.7V$		TBD	
$V_{OH}^{(2)(3)}$	Output high level voltage for an I/O pin, when 8 pins output current	$I_{IO} = +6mA$ $2V < V_{DD} < 2.7V$	TBD		

1. The current absorbed by the chip  $I_{IO}$  must always follow the absolute maximum ratings given in the table, and the sum of  $I_{IO}$  (all I/O feet and control pins) must not exceed  $I_{VSS}$ .
2. The current output  $I_{IO}$  of the chip must always follow the absolute maximum rating given in the table, and the sum of  $I_{IO}$  (all I/O pins and control pins) must not exceed  $I_{VDD}$ .
3. Data based on characterization results. Not tested in production.

### Input/output AC characteristics

The definitions and values of the input and output AC characteristics are given in figure 17 and Table 35, respectively.

Unless otherwise stated, the parameters listed in Table 35 are measured using the ambient temperature and supply voltage in accordance with the condition Table 10.

Table 35. I/O AC characteristics<sup>(1)</sup>

OSPEEDRy [1:0] value (1)	Symbol	Parameter	Conditions	Min	Max	Unit
01 (10MHz)	$f_{max(IO)out}$	Maximum frequency <sup>(2)</sup>	$C_L = 50pF$ , $V_{DD} = 2V \sim 3.6V$		10	MHz
	$t_{f(IO)out}$	Output fall time	$C_L = 50pF$ , $V_{DD} = 2V \sim 3.6V$		25 <sup>(3)</sup>	nS
	$t_{r(IO)out}$	Output rise time			25 <sup>(3)</sup>	
10 (20MHz)	$f_{max(IO)out}$	Maximum frequency <sup>(2)</sup>	$C_L = 50pF$ , $V_{DD} = 2V \sim 3.6V$		20	MHz
	$t_{f(IO)out}$	Output fall time	$C_L = 50pF$ , $V_{DD} = 2V \sim 3.6V$		125 <sup>(3)</sup>	nS

OSPEEDRy [1:0] value (1)	Symbol	Parameter	Conditions	Min	Max	Unit
	$t_{r(IO)out}$	Output rise time			125 <sup>(3)</sup>	
11 (50MHz)	$f_{max(IO)out}$	Maximum frequency <sup>(2)</sup>	$C_L = 30pF$ , $V_{DD} = 2.7V \sim 3.6V$		50	MHz
			$C_L = 50pF$ , $V_{DD} = 2.7V \sim 3.6V$		30	
			$C_L = 50pF$ , $V_{DD} = 2V \sim 2.7V$		20	
	$t_{f(IO)out}$	Output fall time	$C_L = 30pF$ , $V_{DD} = 2.7V \sim 3.6V$		5	nS
			$C_L = 50pF$ , $V_{DD} = 2.7V \sim 3.6V$		8	
			$C_L = 50pF$ , $V_{DD} = 2V \sim 2.7V$		12	
	$t_{r(IO)out}$	Output rise time	$C_L = 30pF$ , $V_{DD} = 2.7V \sim 3.6V$		5	
			$C_L = 50pF$ , $V_{DD} = 2.7V \sim 3.6V$		8	
			$C_L = 50pF$ , $V_{DD} = 2V \sim 2.7V$		12	
	$t_{EXTIpw}$	Pulse width of external signals detected by the EXTI controller		10		nS

1. The speed of the I/O port can be configured via MODEx[1:0]. See the description of the GPIO Port Configuration Register in this chip reference manual.
2. The maximum frequency is defined in figure 17.

Maximum frequency is achieved if  $((t_r + t_f) \leq 2/3)T$ , and if the duty cycle is (45 ~ 55%) when loaded by  $C_L$  (see the i/O AC characteristics definition)

868304

Figure 17. I/O AC characteristics

### 5.3.13 NRST pin characteristics

The NRST pin input driver uses the CMOS technology. It is connected to a permanent pullup resistor,  $R_{PU}$ .

Unless otherwise stated, the parameters listed in the table below are measured using the ambient temperature and  $V_{DD}$  supply voltage in accordance with the condition Table 10.

Table 36. NRST pin characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}^{(1)}$	NRST input low level voltage		-0.5		0.8	V
$V_{IH(NRST)}^{(1)}$	NRST input high level voltage		2		$V_{DD}$	
$V_{hys(NRST)}$	NRST Schmitt trigger voltage hysteresis			$0.2V_{DD}$		V
$R_{PU}$	Weak pull-up equivalent resistor <sup>(2)</sup>	$V_{IN} = V_{SS}$		15		k $\Omega$
$V_{F(NRST)}^{(1)}$	NRST input filtered pulse				100	ns
$V_{NF(NRST)}^{(1)}$	NRST input not filtered pulse		300			

1. Data based on design simulation only. Not tested in production.
2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is minimal (10% order).

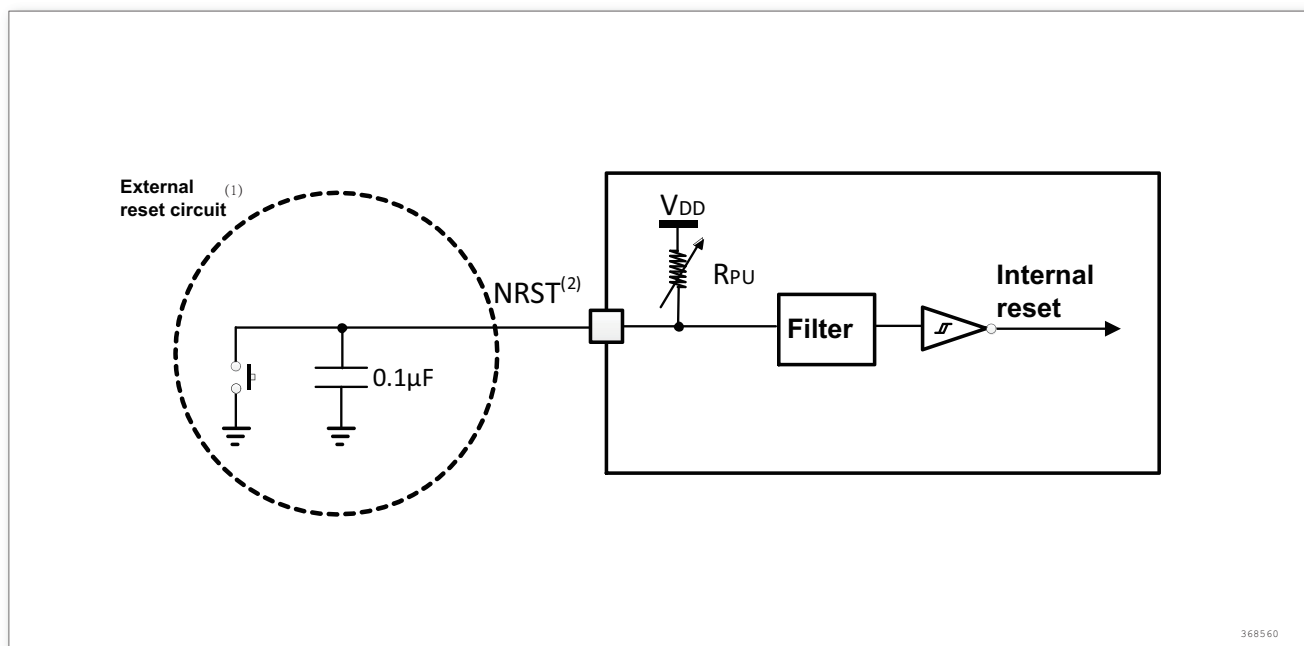

Figure 18. Recommended NRST pin protection

1. The reset network is to prevent parasitic reset
2. The user must ensure that the potential of the NRST pin is below the maximum  $V_{IL(NRST)}$  listed in Table 36, otherwise the MCU cannot be reset.

### 5.3.14 Timer characteristics

The parameters given in the following tables are guaranteed by design.

For details on the characteristics of the I/O multiplexing function pins (output compare, input capture, external clock, PWM output) , see subsubsec 5.3.12.

Table 37. TIMx<sup>(1)</sup> characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time		1		$t_{TIMxCLK}$
		$f_{TIMxCLK} = 96MHz$	10.4		nS
$f_{EXT}$	Timer external clock frequency on CH1 to CH4		0	$f_{TIMxCLK}/2$	MHz
		$f_{TIMxCLK} = 96MHz$	0	48	
$Res_{TIM}$	Timer resolution			16	Bit
$t_{COUNTER}$	16-bit timer maximum period		1	65536	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 96MHz$	0.0104	682	$\mu S$
$t_{MAX\_COUNT}$	The maximum possible count			$65536 \times 65536$	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 96MHz$		44.7	S

1. TIMx is a generic name, representing TIM4.

### 5.3.15 Communication interfaces

#### I2C interface characteristics

Unless otherwise specified, the parameters given in Table 38 are derived from tests performed under the ambient temperature,  $f_{PCLK1}$  frequency and supply voltage conditions summarized in Table 13: General operating conditions.

The I2C interface conforms to the standard I2C communication protocol, but has the following limitations: SDA and SCL are not true pins. When configured as open-drain output, the PMOS transistor between the pin and  $V_{DD}$  was closed but still exists.

The I2C I/Os characteristics are listed in Table 38, the alternate function characteristics of I/Os (SDA and SCL) refer to subsubsec 5.3.12.

Table 38. I2C characteristics

Symbol	Parameter	Standard I2C <sup>(1)</sup>		Fast I2C <sup>(1)(2)</sup>		Unit
		Min	Max	Min	Max	
$t_{w(SCL)}$	SCL clock fall time	4.7		1.3		$\mu$ s
$t_{w(SCLH)}$	SCL clock rise time	4.0		0.6		$\mu$ s
$t_{su(SDA)}$	SDA setup time	250		100		ns
$t_{h(SDA)}$	SDA data hold time	0 <sup>(3)</sup>		0 <sup>(4)</sup>	900 <sup>(3)</sup>	
$t_{r(SDA)} \ t_{r(SDL)}$	SDA and SCL rise time		1000	$2.0+0.1C_b$	300	
$t_{f(SDA)} \ t_{f(SDL)}$	SDA and SCL fall time		300		300	
$t_{h(STA)}$	Start condition hold time	4.0		0.6		$\mu$ s
$t_{su(STA)}$	Start condition setup time	4.7		0.6		
$t_{su(STO)}$	Stop condition setup time	4.0		0.6		
$t_{w(STO:STA)}$	Time from Stop condition to Start condition	4.7		1.3		
$C_b$	Capacitive load of each bus		400		400	pF

1. Guaranteed by design, not tested in production.
2.  $f_{PCLK1}$  must be at least 3MHz to achieve standard mode I2C frequencies. It must be at least 12MHz to achieve fast mode I2C frequencies.
3. The maximum Data hold time has only to be met if the interface does not stretch the low period of SCL signal.
4. In order to span the undefined area of the falling edge of SCL, it must ensure that the SDA signal has a hold time of at least 300ns.

Figure 19. I2C bus AC waveform and measurement circuit<sup>(1)</sup>

1. Measurement point is set to the CMOS level:  $0.3V_{DD}$  and  $0.7V_{DD}$ .

## SPI characteristics

Unless otherwise specified, the parameters given in Table 39 are derived from tests performed under the ambient temperature,  $f_{PCLKx}$  frequency and  $V_{DD}$  supply voltage conditions summarized in Table 13.

Refer to subsubsec 5.3.12 for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

Table 39. SPI characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{SCK} 1/t_{c(SCK)}$	SPI clock frequency	Master mode	0	36	MHz
		Slave mode	0	18	
$t_{r(SCK)}$ $t_{f(SCK)}$	SPI clock rise and fall time	Load capacitance: $C = 30pF$		8	ns
$t_{su(NSS)}^{(2)}$	NSS setup time	Slave mode	$4t_{PCLK}$		
$t_{h(NSS)}^{(2)}$	NSS hold time	Slave mode	73		
$t_{w(SCKH)}^{(2)}$ $t_{w(SCKL)}^{(2)}$	SCK high and low time	Master mode, $f_{PCLK} = 36MHz$ , prescale coefficient = 4	50	60	

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{su(MI)}^{(2)}$	Data input setup time, Master mode	SPI1	1		
$t_{su(SI)}^{(2)}$	Data input setup time, Slave mode		1		

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{h(MI)}^{(2)}$	Data input hold time, Master mode	SPI1	1		ns
$t_{h(SI)}^{(2)}$	Data input hold time, Slave mode		3		
$t_{a(SO)}^{(2)(3)}$	Data output access time	Slave mode, $f_{PCLK} = 36\text{MHz}$ , prescale coefficient = 4	0	55	
		Slave mode, $f_{PCLK} = 24\text{MHz}$		$4t_{PCLK}$	
$t_{dis(SO)}^{(2)(4)}$	Data output disable time	Slave mode	10		
$t_{v(SO)}^{(2)(1)}$	Data output valid time	Slave mode (after enable edge)		25	
$t_{v(MO)}^{(2)(1)}$	Data output valid time	Master mode (after enable edge)		3	
$t_{h(SO)}^{(2)}$	Data output hold time	Slave mode (after enable edge)	25		
$t_{h(MO)}^{(2)}$		Master mode (after enable edge)	4		

1. Remapping SPI1 characteristics needs to be further determined.
2. Data based on characterization results. Not tested in production.
3. Min time is for the minimum time to drive the output and the max time is for the maximum time to validate the data.
4. Min time is for the minimum time to invalidate the output and the max time is for the maximum time to put the data in Hi-Z.

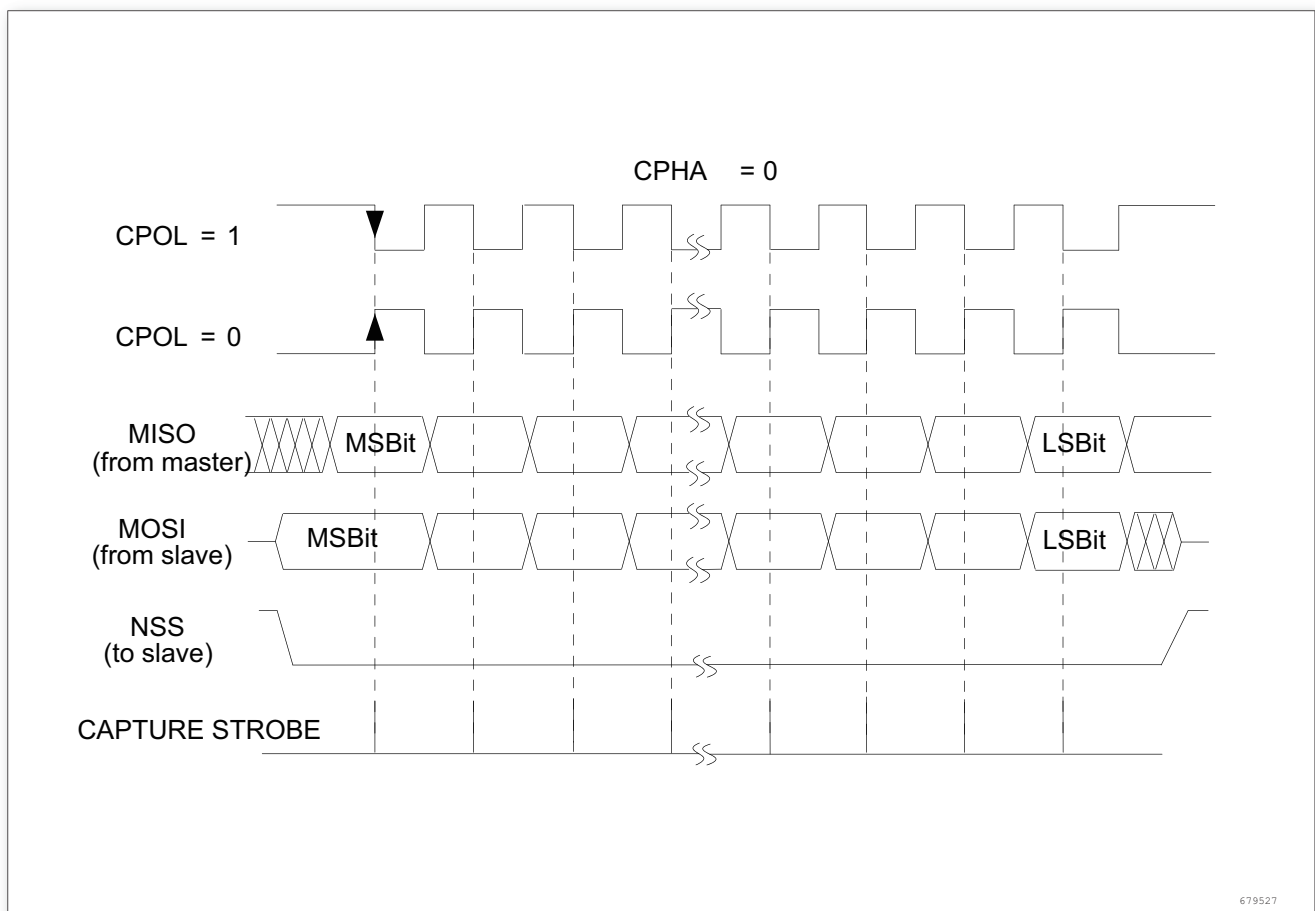

Figure 20. SPI timing diagram-slave mode and CPHA = 0

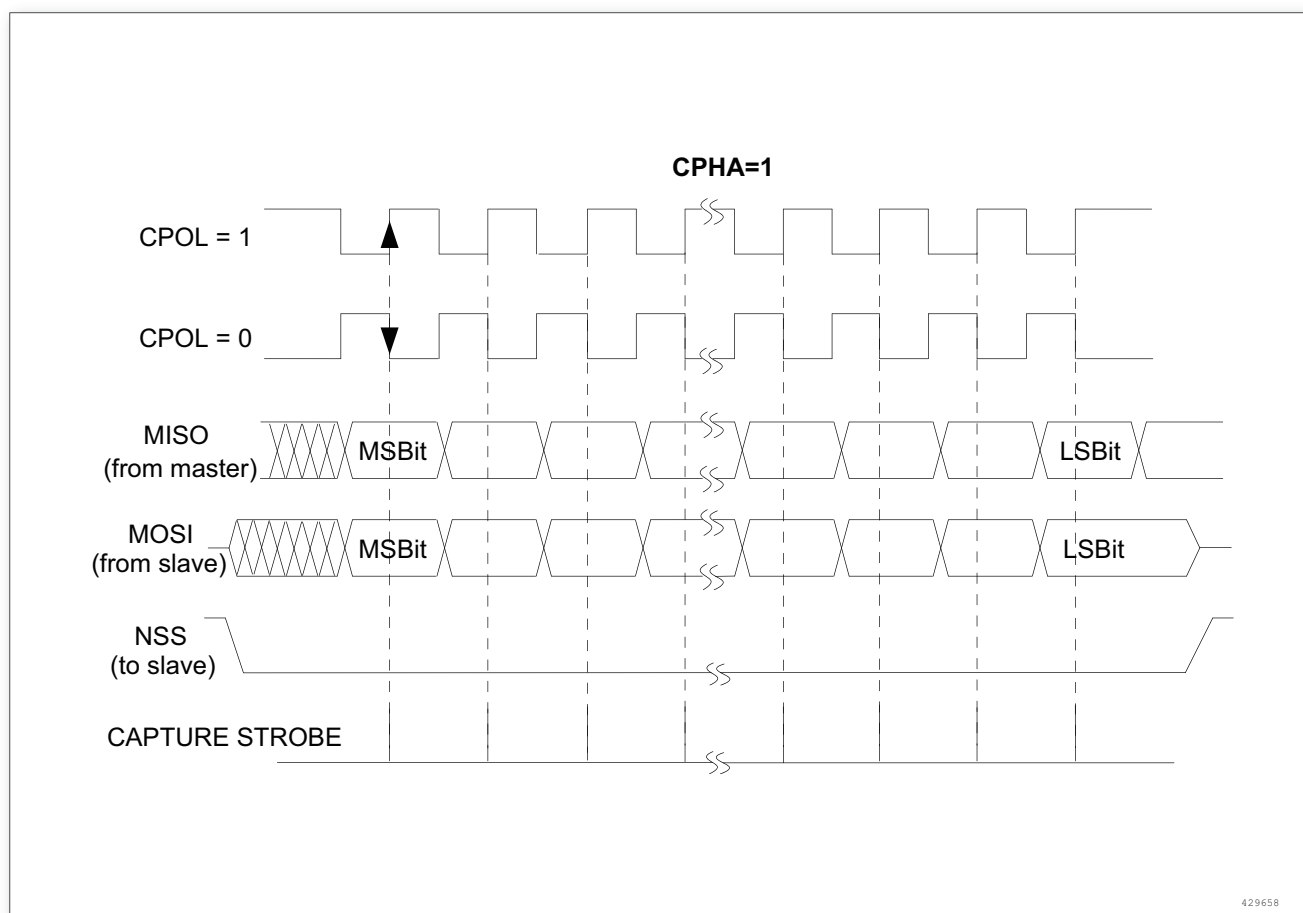

Figure 21. SPI timing diagram-slave mode and CPHA = 1<sup>(1)</sup>

1. Measurement points are done at CMOS levels: 0.3V<sub>DD</sub> and 0.7V<sub>DD</sub>.

## USB characteristics

Table 40. USB startup time

Symbol	Parameter	Max	Unit
$t_{START}^{(1)}$	USB transceiver startup time	1	$\mu s$

1. Guaranteed by design. Not tested in production.

Table 41. USB DC electrical characteristics

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Max <sup>(1)</sup>	Unit
Input levels					
$V_{DD}$	USB operating voltage <sup>(2)</sup>		3.0 <sup>(3)</sup>	3.6	V
$V_{DI}^{(4)}$	Differential input sensitivity	I(USBDP, USBDM)	0.2		

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Max <sup>(1)</sup>	Unit
V <sub>CM</sub> <sup>(4)</sup>	Differential common mode range	Includes V <sub>DI</sub> range	0.8	2.5	
V <sub>SE</sub> <sup>(4)</sup>	Single ended receiver threshold		1.3	2	
Output levels					
V <sub>OL</sub>	Static output level low	R <sub>L</sub> of 1.5kΩ to 3.6V <sup>(5)</sup>		0.3	V
V <sub>OH</sub>	Static output level high	R <sub>L</sub> of 15kΩ to V <sub>SS</sub> <sup>(5)</sup>	2.8	3.6	

1. All the voltages are measured from the local ground potential.
2. To be compliant with the USB 2.0 full-speed electrical specification, USBDP (D +) pin has a built-in 1.5k $\Omega$  resistor connected to the  $V_{DD}$ , no need to external connect.
3. The USB functionality is ensured down to 2.7V but not the full USB electrical characteristics which are degraded in the 2.7V ~ 3.6V  $V_{DD}$  voltage range.
4. Guaranteed by design. Not tested in production.
5.  $R_L$  is the load connected on the USB drivers

Figure 23. USB timing diagram: definition of data signal rise and fall time

Table 42. USB Full-speed electrical characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Max	Unit
$t_r$	Rise time <sup>(2)</sup>	$C_L \leq 50\text{pF}$	7.041	23.13	ns
$t_f$	Fall time <sup>(2)</sup>	$C_L \leq 50\text{pF}$	6.866	26.76	ns
$t_{rfm}$	Rise/fall time matching	$t_r/t_f$	96.52	125.1	%
$V_{CRS}$	Output signal crossover voltage		1.391	2.967	V

1. Guaranteed by design. Not tested in production.
2. Measured from 10% to 90% of the data signal. For more detailed information, please refer to USB Specification - Section 7 (version 2.0).

### 5.3.16 CAN (controller area network) interface

Refer to subsubsec 5.3.12 for more details on the input/output alternate function characteristics (CAN\_TX and CAN\_RX).

### 5.3.17 12-bit ADC characteristics

Unless otherwise specified, The parameters in the table below are measured using the ambient temperature,  $f_{PCLK2}$  frequency and  $V_{DDA}$  supply voltage in accordance with the conditions of Table 13.

*Note: It is recommended to perform a calibration after each power-up*

Table 43. ADC characteristics

Symbol	Parameter	Conditions	Min	Type	Max	Unit
$V_{DDA}$	Supply voltage		2.5	5	5.5	V
$V_{REF+}$	Positive reference voltage			$V_{DDA}$		V
$f_{ADC}^{(1)(3)}$	ADC clock frequency				15	MHz
$f_S^{(1)(3)}$	Sampling rate				1	MHz
$f_{TRIG}^{(1)}$	External trigger frequency	$f_{ADC} = 15\text{MHz}$			833	KHz
					18	1/ $f_{ADC}$
$V_{AIN}^{(2)}$	Conversion voltage range		0 ( $V_{SSA}$ or $V_{REF-}$ connected to ground)		$V_{REF+}$	V
$R_{AIN}^{(1)}$	External sample and hold capacitor		See Formulas 1 and Table 44			k $\Omega$
$R_{ADC}^{(1)}$	Sampling switch resistance				0.75	k $\Omega$
$C_{ADC}^{(1)}$	Internal sample and hold capacitor			10		pF
$t_S^{(1)}$	Sampling time	$f_{ADC} = 15\text{MHz}$	0.1		16	$\mu\text{s}$
			1.5		239.5	1/ $f_{ADC}$
$t_{STAB}^{(1)}$	Stabilization time			1		$\mu\text{s}$
$t_{conv}^{(1)}$	Total conversion time (including Sampling time)	$f_{ADC} = 15\text{MHz}$	1		17.44	$\mu\text{s}$
			15 ~ 253 (sampling $t_{S+}$ ) stepwise approximation 13.5			1/ $f_{ADC}$

1. Guaranteed by design. Not tested in production.
2. In this series of products,  $V_{REF+}$  is internally connected to  $V_{DDA}$ ,  $V_{REF-}$  is internally connected to  $V_{SSA}$ .
3.  $f_{ADC}$  Maximum support 15MHz,  $f_S$  Maximum support 1MHz ( $f_{PCLK2} = 60\text{MHz}$ , ADC Prescaler = 4,  $f_{ADC} = 15\text{MHz}$ ,  $T_S = 1.5$ )

Formula 1: Maximum  $R_{AIN}$  Formula

$$R_{AIN} < \frac{T_S}{f_{ADC} \times C_{ADC} \times (N + 3) \times \ln(2)} - R_{ADC}$$

The above formula (Equation 1) is used to determine the maximum external impedance so that the error can be less than 1/4 LSB. Where  $N = 12$  (representing 12-bit resolution) .  $\ln(2) = 0.69314718$ .

Table 44. Maximum  $R_{AIN}$  at  $f_{ADC} = 15\text{MHz}$ <sup>(1)</sup>

$T_S$ (cycles)	$t_S$ ( $\mu\text{s}$ )	$R_{AIN}$ max ( $k\Omega$ )
1.5	0.1	0.2
7.5	0.5	4.1
13.5	0.9	7.9
28.5	1.9	17.5
41.5	2.8	25.9
55.5	3.7	34.8
71.5	4.8	NA
239.5	16.0	NA

1. Guaranteed by design. Not tested in production.

Table 45. ADC Accuracy - Limit Test Conditions<sup>(1)(2)</sup>

Symbol	Parameter	Test Conditions	Type	Max	Unit
ET	Comprehensive error	$f_{PCLK2} = 60\text{MHz}, f_{ADC} = 15\text{MHz}, R_{AIN} < 10k\Omega, V_{DDA} = 5V, T_A = 25^\circ\text{C}$	8	10	LSB
EO	Offset error		3	3	
EG	Gain error		1	1	
ED	Differential linearity error		6.5	7	
EL	Integral linearity error		8	8	

1. ADC Accuracy vs. Negative Injection Current: Injecting negative current on any of the standard (non-robust) analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current.

Any positive injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in subsubsec 5.3.13 does not affect the ADC accuracy.

2. Guaranteed based on test during characterization. Not tested in production.

ET = Total unadjusted error: The maximum deviation between the actual and ideal transmission curves.

EO = Offset error: The deviation between the first actual conversion and the first ideal conversion.

EG = Gain error: The deviation between the last ideal transition and the last actual transition.

ED = Differential linearity error: The maximum deviation between the actual step and the ideal value.

EL = Integral linearity error: The maximum deviation between any actual conversion and the associated line of the endpoint.

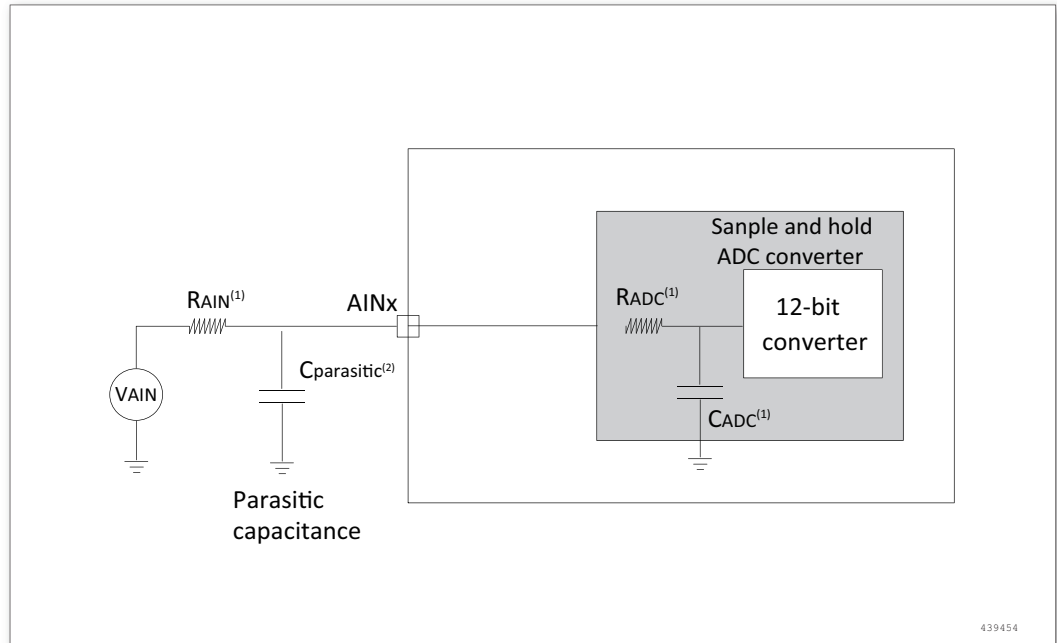

Figure 24. Typical connection diagram using the ADC

1. See Table 45 for the values of  $R_{AIN}$ ,  $R_{ADC}$  and  $C_{ADC}$ .
2.  $C_{parasitic}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7pF) . A high  $C_{parasitic}$  value will downgrade conversion accuracy. To remedy this,  $f_{ADC}$  should be reduced.

## PCB design recommendations

The power supply must be connected as shown below. The 10nF capacitor in the figure must be a ceramic capacitor (good quality) , and they should be as close as possible to the MCU chip.

Figure 25. Power supply and reference power supply decoupling circuit

### 5.3.18 Temperature sensor characteristics

Table 46. Temperature sensor characteristics<sup>(3)</sup> <sup>(4)</sup>

Symbol	Parameter	Min	Type	Max	Unit
$T_L^{(1)}$	$V_{SENSE}$ linearity with respect to temperature		$\pm 5$		$^{\circ}\text{C}$
Avg_Slope <sup>(1)</sup>	Average slope	4.571	4.801	5.984	mV/ $^{\circ}\text{C}$
$V_{25}^{(1)}$	Voltage at 25 $^{\circ}\text{C}$	1.433	1.451	1.467	V
$t_{start}^{(2)}$	Setup time			10	$\mu\text{s}$
$T_{S\_temp}^{(2)}$	ADC sampling time when reading temperature	10			$\mu\text{s}$

1. Guaranteed based on test during characterization. Not tested in production.
2. Guaranteed by design. Not tested in production.
3. The shortest Sampling time can be determined by the application through multiple iterations.
4.  $V_{DD} = 3.3\text{V}$ .

### 5.3.19 Comparator characteristics

Table 47. Comparator characteristics

Symbol	Parameter	Register configuration	Min	Type	Max	Unit
HYST	Hysteresis	00		0		mV
HYST	Hysteresis	01		15		mV
HYST	Hysteresis	10		30		mV

Symbol	Parameter	Register configuration	Min	Type	Max	Unit
HYST	Hysteresis	11		90		mV
OFFSET	Offset voltage	00	0.091	0.213	0.358	mV
OFFSET	Offset voltage	01	3.23	7.51	12.08	mV
OFFSET	Offset voltage	10	9.79	15	20.8	mV
OFFSET	Offset voltage	11	34.25	47.4	62.22	mV
DELAY <sup>(1)</sup>	Propagation delay	00		80		nS
DELAY <sup>(1)</sup>	Propagation delay	01		51		nS
DELAY <sup>(1)</sup>	Propagation delay	10		26		nS
DELAY <sup>(1)</sup>	Propagation delay	11		9		nS
I <sub>q</sub> <sup>(2)</sup>	Operating current mean	00		4.5		uA
I <sub>q</sub> <sup>(2)</sup>	Operating current mean	01		4.4		uA
I <sub>q</sub> <sup>(2)</sup>	Operating current mean	10		4.4		uA
I <sub>q</sub> <sup>(2)</sup>	Operating current mean	11		4.4		uA

1. The output flips 50% of the time and the time difference between the input and the flip.
2. Total current consumption, operating current.

## 6

## Package information

## Package information

## 6.1 LQFP48 Package information

Figure 26. LQFP48 - 48-pin low-profile quad flat package outline

1. Drawing is not to scale.
2. Dimensions are expressed in millimeters.

Table 48. LQFP48 mechanical data

Symbol	Millimeters		
	Min	Typ	Max
A			1.60
A1	0.05		0.15
A2	1.35	1.40	1.45
A3	0.59	0.64	0.69
b	0.18		0.27
b1	0.17	0.20	0.23
c	0.13		0.18
c1	0.12	0.127	0.134
D	8.80	9.00	9.20
D1	6.90	7.00	7.10
E	8.80	9.00	9.20
E1	6.90	7.00	7.10
e		0.50	
L	0.45	0.60	0.75
L1	1.00REF		
L2	0.25BSC		
R1	0.08		
R2	0.08		0.20
S	0.20		
N	Number of pins = 48		

## 6.2 LQFP32 Package information

Figure 27. LQFP32 - 32-pin low-profile quad flat package outline

1. Drawing is not to scale.
2. Dimensions are expressed in millimeters.

Table 49. LQFP32 mechanical data

Symbol	Millimeters		
	Min	Typ	Max
A			1.60
A1	0.05		0.15
A2	1.35	1.40	1.45
A3	0.59	0.64	0.69
b	0.32		0.43
b1	0.31	0.35	0.39
c	0.13		0.18
c1	0.12	0.127	0.134

Symbol	Millimeters		
	Min	Typ	Max
D	8.80	9.00	9.20
D1	6.90	7.00	7.10
E	8.80	9.00	9.20
E1	6.90	7.00	7.10
e		0.80	
L	0.45	0.60	0.75
L1	1.00REF		
L2	0.25BSC		
R1	0.08		
R2	0.08		0.20
S	0.20		
N	Number of pins = 32		

### 6.3 QFN32 Package information

978941

Figure 28. QFN32 - 32-pin quad flat no-leads package outline

1. Drawing is not to scale.
2. Dimensions are expressed in millimeters.

Table 50. QFN32 mechanical data

Symbol	Millimeters		
	Min	Typ	Max
A	0.7	0.75	0.80
A1	0.00	0.02	0.05
A2	0.50	0.55	0.60
A3	0.20REF		
b	0.20	0.25	0.30
D	4.90	5.00	5.10
E	4.90	5.00	5.10
D2	3.40	3.50	3.60

Symbol	Millimeters		
	Min	Typ	Max
E2	3.40	3.50	3.60
e		0.5	
H	0.30REF		
K	0.35REF		
L	0.35	0.40	0.45
R	0.09		
c1		0.08	
c2		0.08	
N	Number of pins = 32		

## 6.4 TSSOP20 Package information

Figure 29. TSSOP20 - 20-lead thin shrink small outline package outline

1. Drawing is not to scale.
2. Dimensions are expressed in millimeters.

Table 51. TSSOP20 mechanical data

Symbol	Millimeters		
	Min	Typ	Max
A			1.20
A1	0.05		0.15
A2	0.8	1.00	1.05
b	0.19		0.30
c	0.09		0.20
D	6.40	6.50	6.60
E	6.25	6.40	6.55
E1	4.30	4.40	4.50

Symbol	Millimeters		
	Min	Typ	Max
e	0.65		
L	0.45	0.60	1
L1	0.45		0.75
N	Number of pins = 20
